SQLCMD is a tool that will perform SQL queries from the command line or batch files. Many times I've wished for a simple way to run SQL queries from a batch file, or have a commandline-based SQL query tool, so AnalogX SQLCMD was born. AnalogX SQLCMD is pretty simple, it just allows you to specify a database, username and password (if necessary) and a SQL query you wish to perform. The results are either output to the screen, or alternatively output into a log file that you specify. Very simple to use but if you've needed the functionality in the past, you know how handy it can be. Please Note: This program is a commandline application.

SQLCMD is a commandline SQL Query tool. SQLCMD allows you to perform SQL Queries on a specified database. You can either run a single query or you can run a query in batch mode.

Options: /batch[=value] Enables batch mode. By default SQLCMD runs one query per line.

Optionally you can specify a file with queries on which to run. /dbname[=value] Specifies the database to query. /user[=value] Specifies the username to authenticate with. /password[=value]

Specifies the password to authenticate with. /logpath[=value] If the "logpath" option is specified, SQLCMD will output all queries to a specified file. If no path is specified then SQLCMD will

output queries to standard output. Example: SQLCMD -database=c:\sql.database

-user=analogx\sqluser -password=sqluser SQLCMD -dbname=c:\sql.database

-user=analogx\sqluser -password=sqluser /logpath=c:\sql.outputfile This would output all queries to the file specified as "c:\sql.outputfile". Options: /run[=value] You may specify whether or not to

run the query or if you'd like to run the query immediately, this is useful if you want to use the results of the query elsewhere or to run a query with different parameters. Example: SQLCMD

-run -database=c:\sql.database -user=analogx\sqluser -password=sqluser SQLCMD -run

-dbname=c:\sql.database -user=analogx\sqluser -password=sqluser /n This will cause SQLCMD to "run" the query but not actually return any results. System requirements: Windows 8+ SQLCMD

can be used on all modern Windows versions. It can be run in 32 or 64bit mode. You must have administrator privileges to run SQLCMD. Why would you use this tool? There are many reasons

you may want to use SQLCMD. When you want to use the results of a SQL query from within a batch script. When you need to query a database when you
