Sunday, May 29, 2009 It was going to be a rough day because Mr. Rector had an exam this morning. But I thought I would start off a bit cheery with the second one of our favorite quizzes. Where do you think Joel is from? 1. Joel 2. Sub-Saharan Africa 3. Southeast Asia 4. Afghanistan 5. Sudan If you answered 1 or 2- Joel is a native of Europe. If you answered 3, 4, or 5- Joel is from an African country. A. It was going to be a rough day because Mr. Rector had an exam this morning. But I thought I would start off a bit cheery with the second one of our favorite quizzes. Where do you think Joel is from? the effects of proton removal from the hydrogenated silicon oligomer are also omitted, as their effects do not affect the results significantly. In the monomer-dimer equilibrium, the dimers and the monomers are linearly related, so the dimer-to-monomer ratio is one minus the degree of hydrogenation. In summary

Six Sigma: Primer Questions Crack + [Win/Mac]

- Introduction to Six Sigma basic understanding, the basic techniques, the different types of the indicator and theories - A set of questions based on the CSSBB model - Full version of the Java applet Six sigma: primer questions Serial KeyQ: Firebase: Adding Child Nodes I'm trying to add child nodes to my database under the "users" location with a Structure like this: Users UserId email password pictureUrl If I got these two Variables: String email = "email"; String password = "password"; And I'll call the addChildNodes() method: Ref.child("users").child(Firebase.getUserId()) .child(firebase.getUserId().toString()) .child(email) .child(password) .child(pictureUrl) .addChildNodes(); Does this work? What am I missing? A: According to the documentation Child nodes can be referenced by their key: If the key is a relative path (under ref/users) then the child will be added to the user data. Otherwise, the child is added to the root / under the users path. So if you have a name for the user (e.g userid) the key should be userid. If you do not specify a name it will be generated by the userId: The method does nothing if ref already contains a node with the same name. For example: // Add a new child node Firebase ref = new Firebase(""); String key = "users/userid"; // userid ref.child(key).child(userid).child(pictureUrl).child(email).child(password).addChildNodes(); If you use the key generation I mentioned the resulting key will be a relative path under userid. So you should use this key in your ref like a69d392a70
